Background

Hylomorphisms

Fold over Lists

One way to guarantee **recursive functions** are **well-defined** is via **Recursion Schemes**.

```
foldr :: (a -> b -> b) -> b -> [a] -> b
foldr g b [] = b
foldr g b (x : xs) = g x (foldr g b xs)
```

There are many different kinds of Recursion Schemes (e.g. Folds, Paramorphisms, Unfolds, Apomorphisms, ...)

Folds as Initial Algebras

```
data Fix f = In { in0p :: f (Fix f) }
```

```
fold :: Functor f =>  
      (f x -> x) ->  
      Fix f ->  
      x
```

```
fold a = f  
  where f (In x) = (a . fmap f) x
```

Folds as Initial Algebras

Least Fixed-Point
 $\text{Fix } f \cong f (\text{Fix } f)$

```
data Fix f = In { in0p :: f (Fix f) }
```

```
fold :: Functor f =>  
      (f x -> x) ->  
      Fix f ->  
      x
```

```
fold a = f  
  where f (In x) = (a . fmap f) x
```

$$\begin{array}{ccc} f (\text{Fix } f) & \xrightarrow{\quad} & f \, x \\ \text{In} \downarrow & & \downarrow a \\ \text{Fix } f & \xrightarrow{\quad} & x \end{array}$$

Folds as Initial Algebras

```
data Fix f = In { in0p :: f (Fix f) }
```

```
fold :: Functor f =>  
      (f x -> x) ->  
      Fix f ->  
      x
```

```
fold a = f  
  where f (In x) = (a . fmap f) x
```

f-algebra

Folds as Initial Algebras

```
data Fix f = In { in0p :: f (Fix f) }
```

```
fold :: Functor f =>  
    (f x -> x) ->  
    Fix f ->  
    x
```

```
fold a = f  
  where f (In x) = (a . fmap f) x
```

initial f-algebra

Hylomorphisms: Divide-and-conquer Computations

```
hylo :: Functor f =>  
    (f b -> b) ->  
    (a -> f a) ->  
    a -> b  
hylo a c = a . fmap (hylo a c) . c
```

Hylomorphisms: Divide-and-conquer Computations

```
hylo :: Functor f =>  
    (f b -> b) ->  
    (a -> f a) ->  
    a -> b
```

```
hylo a c = a . fmap (hylo a c) . c
```

f-coalgebra
"divide"

Hylomorphisms: Divide-and-conquer Computations

```
hylo :: Functor f =>
  (f b -> b) ->
  (a -> f a) ->
  a -> b
hylo a c = a <-> fmap (hylo a c) . c
```

f-algebra
"conquer"

Folds as Hylomorphisms

```
data Fix f = In { inOp :: f (Fix f) }
```

```
fold :: Functor f =>  
      (f x -> x) ->  
      Fix f ->  
      x
```

```
fold a = a ← fmap (fold a) . inOp
```

f-coalgebra

$f \text{ (Fix } f) \cdots \cdots \rightarrow f \text{ } x$
 $\text{inOp} \uparrow \qquad \qquad \downarrow a$
 $\text{Fix } f \cdots \cdots \rightarrow x$

f-algebra

Example: Nonstructural Recursion

```
data TreeF a b = Leaf | Node b a b
```

```
split [] = Leaf
```

```
split (h : t) = Node l h r
```

```
  where
```

```
    (l, r) = partition (\x -> x < h) t
```

```
merge Leaf = \acc -> acc
```

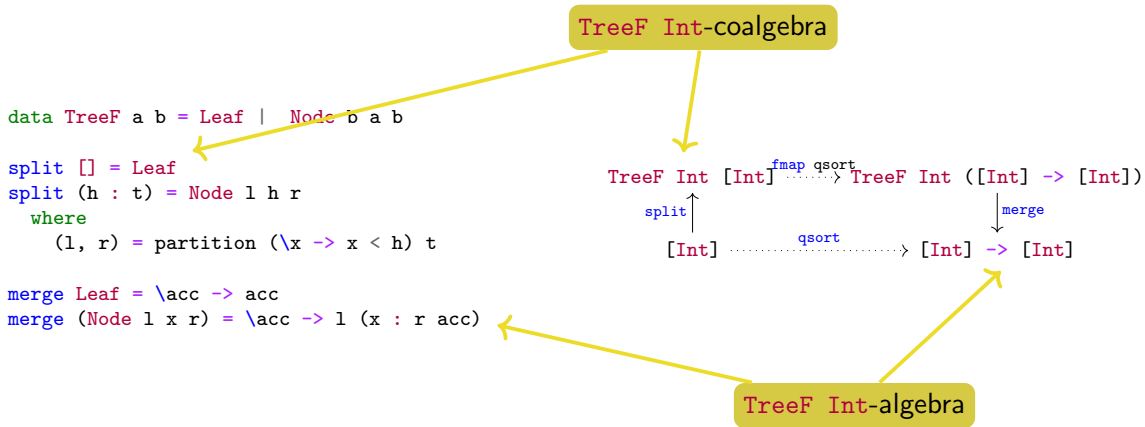

```
merge (Node l x r) = \acc -> l (x : r acc)
```

```
TreeF Int [Int]  $\xrightarrow{\text{fmap qsort}}$  TreeF Int ([Int] -> [Int])
```

Diagram illustrating the recursive structure of the merge sort algorithm using the `TreeF` type:

- The input list `[Int]` is split into two parts (indicated by the `split` arrow).
- Each part is recursively sorted using `qsort` (indicated by the `qsort` arrow).
- The sorted parts are mapped over the `TreeF` structure using `fmap` (indicated by the `fmap` arrow).
- The resulting `TreeF Int ([Int] -> [Int])` structure is then merged back into a single list using the `merge` function (indicated by the `merge` arrow).

Example: Nonstructural Recursion

Conjugate Hylomorphisms

Every recursion scheme is a conjugate hylomorphism

<i>recursion scheme</i>	<i>adjunction</i>	<i>conjugates</i>	<i>para-hylo equation</i>	<i>algebra</i>
(hylo-shift law)	$\text{Id} \dashv \text{Id}$	$\alpha \dashv \alpha$	$x = a \cdot (\text{id} \triangle D x \cdot \alpha C \cdot c) : A \leftarrow C$	$a : C \times D A \rightarrow A$
mutual recursion	$\Delta \dashv (\times)$	ccf	$x_1 = a_1 \cdot (\text{id} \triangle D (x_1 \triangle x_2) \cdot c) : A_1 \leftarrow C$ $x_2 = a_2 \cdot (\text{id} \triangle D (x_1 \triangle x_2) \cdot c) : A_2 \leftarrow C$	$a_1 : C \times D (A_1 \times A_2) \rightarrow A_1$ $a_2 : C \times D (A_1 \times A_2) \rightarrow A_2$
accumulator	$- \times P \dashv (-)^P$	ccf	$x = a \cdot (\text{outl} \triangle ((D (\wedge x) \cdot c) \times P)) : A \leftarrow C \times P$	$a : C \times D (A^P) \times P \rightarrow A$
course-of-values (§5.6)	$U_D \dashv \text{Cofree}_D$	ccf	$x = a \cdot (\text{id} \triangle D (D_\infty x \cdot [c]) \cdot c) : A \leftarrow C$	$a : C \times D (D_\infty A) \rightarrow A$
finite memo-table (§5.6)	$U_* \dashv \text{Cofree}_*$	ccf	$x = a \cdot (\text{id} \triangle D (D_* x \cdot [c]_*) \cdot c) : A \leftarrow C$	$a : C \times D (D_* A) \rightarrow A$

Table 1. Different types of para-hylos building on the canonical control functor (ccf); the coalgebra is $c : C \rightarrow D C$ in each case.

Why Mechanising Hylomorphisms in Coq?

- Structured Recursion Schemes have been used in Haskell to structure functional programs, but they do not ensure termination/productivity
- On the other hand, Coq does not capture all recursive definitions
- The benefits of formalising hylos in Coq is three fold:
 - Giving the Coq programmer a **library** where for most recursion schemes they do not have to prove termination properties
 - **Extracting code** into ML/Haskell to provide termination guarantees even in languages with non-termination
 - Using the laws of hylomorphisms as tactics for **program calculation** and **optimisation**

Challenges

1. Avoiding axioms: functional extensionality, heterogeneous equality,
2. Extracting “clean” code: close to what a programmer would have written directly in OCaml.
3. Fixed-points of functors, non-termination, etc.

Challenges

1. Avoiding axioms: functional extensionality, heterogeneous equality,
2. Extracting “clean” code: close to what a programmer would have written directly in OCaml.
3. Fixed-points of functors, non-termination, etc.

Our solutions (the remainder of this talk):

1. Machinery for building setoids, use of decidable predicates, . . .

Challenges

1. Avoiding axioms: functional extensionality, heterogeneous equality,
2. Extracting “clean” code: close to what a programmer would have written directly in OCaml.
3. Fixed-points of functors, non-termination, etc.

Our solutions (the remainder of this talk):

1. Machinery for building setoids, use of decidable predicates, . . .
2. Avoiding type families and indexed types.
